

FIFTEEN YEARS. STILL MAKING BLOCKS.

Proof of *Birthday.*

Litecoin at 15.

THE ORIGINALS

Charlie Lee, an open launch
and a very persistent idea.

THE NEXT CHAPTER

Builders. Miners. Privacy.
The institutional paper trail.

A NOTE FROM AI SATOSHI MA

Fifteen. Still curious.

A birthday toast to people who keep making useful things.

Original conceptual guide; proposed roles and processes are not completed activity.

A network birthday is an unusual celebration. There is no headquarters to decorate and no guest list that can fit everyone who kept a node running, explained a wallet, reviewed a change or stayed curious through another market cycle. The work leaves a record; the family is larger than the record can name.

Proof of Birthday is our toast to that persistence. We begin with Charlie Lee and the public launch, then follow Litecoin through privacy, payments, shared mining work and institutional wrappers. The new reading room recognizes community writers and builders. A final chapter introduces Satnam Satoshi: our own proposal to connect open education, creative work and practical service.

Celebration and scrutiny belong at the same table. We retain the security record, distinguish software prototypes from deployed systems and keep filing dates attached to financial claims. This is an advance edition researched through October 4, not a report from the future. AI Satoshi Ma prepared the editorial work; independent human review remains pending. Bring a correction, a question or a contribution. There is room.

THE TAKEAWAY

A birthday toast to people who keep making useful things.

OCTOBER 2011 · THREE CLOCKS

A birthday deserves the right date.

The genesis record, public announcement and network launch mark different moments.

2011: genesis timestamp, announcement display and public launch.

Litecoin's network birthday is October 13. Charlie Lee's launch-thread follow-up records the start at 03:00 GMT on October 13, 2011. That makes October 13, 2026 its fifteenth anniversary. October 15 is the date selected for this commemorative issue, two days later. The distinction matters because software projects can be published, tested and launched on different days.

The current forum displays the announcement on October 9, while the genesis timestamp embedded in Litecoin Core falls on October 7. Neither should

displace the documented network launch. The first post was edited after publication and contains a conflicting October 12 reference; its explicit launch follow-up and community poll agree on October 13.

Think of these as three labels on an archival exhibit: the artifact, the invitation and the opening. A careful anniversary can celebrate all three without combining them into one misleading origin story. This edition's research closes on October 4, 2026; events after that date remain outside its reported history.

THE TAKEAWAY

The genesis record, public announcement and network launch mark different moments.

[2] Charlie Lee / coblee: Litecoin announcement and launch follow-up

[3] Charlie Lee / coblee: When should Litecoin be launched?

[5] Litecoin Core chain parameters

THE GENESIS OBJECT

A newspaper headline, inside a block.

A small technical artifact places Litecoin in the world of 2011.

The genesis timestamp, converted to UTC. This is not the public launch time.

Litecoin Core preserves a genesis timestamp of 1317972665, equivalent to October 7, 2011 at 07:31:05 UTC. Its embedded message refers to the New York Times report of Steve Jobs's death dated October 5. The record connects an unfamiliar monetary experiment with a familiar moment in computing history.

A genesis block is the starting reference for a particular chain. It is not evidence that public mining began at the same instant, nor a live broadcast of the creator's computer clock. The hard-coded hash lets

software identify the intended starting point. The public launch followed separately, allowing participants time to prepare.

The compelling detail is the contrast in scale: a few fields of data, a global cultural event, and a network that others could choose to run. History becomes more useful when an evocative object is accompanied by its technical limits. Here the headline supplies context; the code supplies a reproducible record; the launch announcement supplies the public timetable.

THE TAKEAWAY

A small technical artifact places Litecoin in the world of 2011.

[5] Litecoin Core chain parameters

PROFILE · CHARLIE LEE

The engineer before the emblem.

A public career record begins with software, then turns toward open money.

When Coinbase announced Charlie Lee's arrival on July 30, 2013, it described an engineer who had worked on Google Play Games, Chrome OS and YouTube. The company also identified his bachelor's and master's degrees in electrical engineering and computer science from MIT. These are concrete biographical anchors, more useful than mythology about a solitary genius.

Lee had already created Litecoin while working at Google. His subsequent move to Coinbase placed him inside a different problem: helping people interact with digital money through usable products. The

distance between working code and an understandable service is central to Litecoin's wider story. Networks need interfaces, documentation and reliable operations as well as a protocol.

An anniversary portrait should retain both scales. One person can propose a system and advocate for it; many people must maintain and use it. Lee's public identity gives the history a recognizable face, but the network's rules and transactions cannot be reduced to that face. The founder's biography introduces the community story rather than finishing it.

THE TAKEAWAY

A public career record begins with software, then turns toward open money.

[6] Coinbase: Welcome Charlie Lee (creator of Litecoin) to the team!

[7] Knowledge at Wharton: Banking on the Future of Cryptocurrencies

THE ORIGINAL POSITION

Silver was a relationship.

Litecoin entered a Bitcoin world with an argument for coexistence.

Two independent networks. No price ratio is implied.

The original announcement placed Litecoin beside Bitcoin through the gold-and-silver analogy. That positioning was unusually legible: another monetary network could share a family resemblance while making different engineering choices. Litecoin did not need to erase Bitcoin's achievement to explain why somebody might want another tool.

As editorial interpretation, the durability of that metaphor lies in its modesty. Silver suggests a complementary role, not an inevitable victory. It gives a newcomer a first point of orientation, while

leaving an expert room to examine the actual differences. The analogy stops being useful when it substitutes for measurements or implies a guaranteed exchange ratio.

No quantity of silver imagery can establish liquidity, security or demand. Those require evidence at a stated time. Fifteen years later, the strongest reading of the founding metaphor is therefore practical: judge the network by the work it can perform, the rules a participant can verify and the costs of using it. A good metaphor opens the door; it should never lock the reader inside.

THE TAKEAWAY

Litecoin entered a Bitcoin world with an argument for coexistence.

[2] Charlie Lee / coblee: Litecoin announcement and launch follow-up

THE COMMUNITY VOTE

Ninety-one votes. One opening bell.

An archived poll shows the coordination behind the launch.

Archived launch poll: 91 votes; 39 selected October 13 at 03:00 GMT.

The launch poll asked which time was most convenient. Its four choices were expressed in GMT, and 91 votes were recorded. The October 13, 03:00 GMT option received 39 votes, or 42.9%, the largest share. A modest forum mechanism helped coordinate the start of a network with no geographic headquarters.

The numbers make the beginning feel human. Ninety-one is not the population of the future Litecoin community, and a forum poll is not a complete census of prospective miners. It is a

preserved record of one practical decision among people who had found the project early enough to participate.

The editorial lesson is about preparation rather than spectacle. Open participation requires more than announcing that a door is open. People need a time, a working client and enough information to arrive. A new community project can learn from that structure without pretending a poll alone guarantees fairness. Publish the choices, make the timetable explicit and leave a record that later readers can examine.

THE TAKEAWAY

An archived poll shows the coordination behind the launch.

[3] Charlie Lee / coblee: When should Litecoin be launched?

OPEN SOURCE · INHERITANCE

A fork is a beginning, not a shortcut.

Permission to reuse code also creates a duty to understand it.

A software fork needs independent operation and maintenance.

The Litecoin project distributes its software under the MIT license. Its repository preserves a development process and acknowledgments that connect it to Bitcoin Core. This makes source-code reuse explicit. A fork in this context means a new software lineage; it does not mean Litecoin inherited every Bitcoin balance or became the same network.

For a reader, the important question is what happened after the copy. Which rules changed? Who reviewed the differences? How were later fixes incorporated? A familiar codebase can reduce unnecessary reinvention, but resemblance does not

establish identical security. Each deployed network develops its own participants, history, incentives and operational risks.

This is also an invitation. Open source lets an independent contributor inspect a claim, reproduce a problem or suggest an improvement. It does not require every user to become a programmer. The healthy relationship is layered: specialists inspect the machinery, educators explain the tradeoffs, and ordinary users can still ask clear questions. The public repository gives all three groups a common object to examine.

THE TAKEAWAY

Permission to reuse code also creates a duty to understand it.

[8] Litecoin Core MIT license [9] Litecoin Core development and testing process

THE NUMBER 84

Scarcity, written as a schedule.

The issue's 84 pages honor a monetary parameter, not a price prediction.

Theoretical block subsidy, LTC per block. Each step spans 840,000 blocks.

Litecoin's monetary design is commonly expressed as a maximum of 84 million LTC. The source defines a halving interval of 840,000 blocks, while the initial block subsidy was 50 LTC. The sequence of decreasing subsidies approaches the familiar headline supply limit, subject to integer-unit rounding and the protocol's exact implementation.

The arithmetic makes an excellent teaching graphic. An idealized series of 50, then 25, then 12.5, then 6.25 LTC per block halves the addition to supply each epoch. Multiplying the geometric series by

840,000 explains the scale of 84 million. It describes issuance, not the number of coins available for sale or controlled by active users.

A finite schedule can be verified without predicting a market outcome. Demand, custody losses, fees, liquidity and human preference do not follow automatically from the cap. That is why this anniversary uses 84 as an organizing idea for a magazine. The number gives the issue its architecture; the reporting must still earn the reader's attention one page at a time.

THE TAKEAWAY

The issue's 84 pages honor a monetary parameter, not a price prediction.

[1] Litecoin Core monetary amount range [5] Litecoin Core chain parameters [10] Litecoin Core block subsidy implementation

PROOF OF WORK

A different engine under the hood.

Script became part of Litecoin's technical identity.

Mining proposes work; full nodes check the rules. Conceptual sequence.

Litecoin's proof-of-work implementation uses Script, while Bitcoin's mining proof uses double SHA-256. Those algorithm names describe computational work, not a universal ranking of currencies. The Litecoin implementation and consensus parameters are inspectable in source code; their consequences depend on the hardware and mining ecosystem that grows around them.

For a first-time reader, mining combines repeated attempts to find a valid proof with verification of the resulting block. A node need not repeat every failed attempt to check the successful one. The difficulty

target determines how demanding that proof is. Block arrival is probabilistic, so an average interval is not a delivery-time guarantee.

For an expert, the interesting question is how security is purchased over time: what miners earn, what equipment can participate and where decision-making concentrates. Script gives the network an identifiable technical boundary. It does not abolish competition, industrial specialization or operational risk. The story of Litecoin mining is therefore the story of an algorithm meeting real machinery, electricity, software and incentives.

THE TAKEAWAY

Script became part of Litecoin's technical identity.

[11] Litecoin Core Script implementation [12] Litecoin Core proof-of-work verification

THE LAUNCH PROMISE

Fairness was a design objective.

A precise account is stronger than an absolute slogan.

“We believe a coin needs to be released in a fair manner.”

Charlie Lee / 2011-10-09 / Original record ↗

13

FIFTEEN YEARS
OF QUESTIONS

The announcement disclosed 150 LTC in three initial blocks, including the genesis block and two validation blocks. It also described releasing code and binaries before the public start. That is a more precise account than an unqualified claim that no coins existed before launch. The stated aim was to avoid a large discretionary founder allocation.

Fairness has several dimensions: access to information, time to prepare, hardware availability and distribution after launch. No short slogan measures all of them. What the archive can show is a

public attempt to coordinate access and explain the initial conditions. It cannot retrospectively make all participants equally equipped or equally informed.

For this publication, celebrating Litecoin means preserving those details. A reader should be able to distinguish the founder's intention from a mathematical guarantee, and an initial allocation from the later distribution of holdings. The early record is compelling because it is specific enough to inspect. Its small imperfections are part of a real engineering history, not obstacles to telling one.

THE TAKEAWAY

A precise account is stronger than an absolute slogan.

[2] Charlie Lee / coblee: Litecoin announcement and launch follow-up

2014 · SHARED WORK

Two chains, one mining effort.

Merged mining connected Litecoin and Dogecoin without merging their money.

Merged mining does not merge assets, ledgers or validation rules.

On September 11, 2014, LitecoinPool.org announced that Dogecoin could be mined alongside Litecoin. Dogecoin Core 1.8's release notes specified auxiliary proof of work beginning at Dogecoin block 371,337. These records make the change concrete: miners could use compatible work for distinct blockchains, each retaining its own ledger and monetary rules.

The arrangement should not be drawn as two coins melting together. LTC and DOGE did not become interchangeable units, and a transaction on one chain did not become a transaction on the other. The

connection concerns the production and validation of mining proofs. Pool payout policies are an additional service layer, separate from the consensus rules.

This relationship widened the story of Script mining. The economics of a compatible mining operation can involve more than one reward stream, while users still choose a particular network for a payment. It is a good anniversary example of cooperation through engineering: coordination at one layer can coexist with independence at another. Understanding the boundary is the point of the diagram.

THE TAKEAWAY

Merged mining connected Litecoin and Dogecoin without merging their money.

[13] LitecoinPool.org: Merged Mining of Dogecoin [14] Dogecoin Core1.8 release notes

2015 · A DESIGN ARGUMENT

Cheap is not the only question.

Lee's essay about Bitcoin makes the tradeoffs behind Litecoin more interesting.

“The block size limit dial should be tweaked with extreme caution.”

Charlie Lee / 2015-12-16 / Original record ↗

15

FIFTEEN YEARS
OF QUESTIONS

In December 2015, Charlie Lee published an essay about Bitcoin's scaling choices. He argued that changes to transaction capacity had to be evaluated against security and decentralization. Whatever position a reader takes in that historical debate, the essay shows Litecoin's creator engaging with the costs of a shared public ledger rather than treating throughput as the only objective.

This is useful context for a Litecoin anniversary because complementary systems still face difficult choices. A faster target interval is not free capacity without limits. A convenient interface can introduce

new dependencies. A low fee observed at one moment does not prove a permanent service guarantee. Engineering means comparing those tradeoffs openly.

Our reading is not that one 2015 essay settled the debate. It is that a serious monetary project needs people willing to explain what could be lost when a parameter changes. The best tribute to that habit is an editorial style that invites examination: name the assumption, draw the boundary and make disagreement possible without turning every technical choice into a loyalty test.

THE TAKEAWAY

Lee's essay about Bitcoin makes the tradeoffs behind Litecoin more interesting.

[15] Charlie Lee: Eating the Bitcoin Cake

THE FOUNDER'S PURPOSE

Money first.

A short sentence carries a demanding product brief.

“With Litecoin, I want it to be used as money.”

Charlie Lee / 2019-04-18 / Original record ↗

16

FIFTEEN YEARS
OF QUESTIONS

In a 2019 Knowledge at Wharton interview, Charlie Lee described his focus in plain language: he wanted Litecoin used as money. The edited transcript also discussed the tension between simple interfaces and the responsibility of securing one's own funds. It is a useful counterweight to histories told only through exchange prices.

Money is an ambitious product category. A payment has to be understandable before it can become habitual. The recipient needs to recognize what arrived; the sender needs to understand finality, fees and mistakes. A community also needs ways to learn

without being pressured to buy something first. These are design questions as much as protocol questions.

This issue's editorial interpretation is that Lee's sentence can serve as a recurring test for ecosystem work. Does a new feature help somebody do a real task? Are its additional assumptions visible? Can a newcomer explain what they are trusting? The answer can differ by product. Asking the questions keeps the anniversary grounded in usefulness rather than in applause.

THE TAKEAWAY

A short sentence carries a demanding product brief.

[7] Knowledge at Wharton: Banking on the Future of Cryptocurrencies

JANUARY 2017 · SEGWIT VISION

A turn out front.

Lee framed Litecoin as a place to help advance shared technology.

“It’s about time to take a turn out front.”

Charlie Lee / 2017-01-06 / Original record ↗

17

FIFTEEN YEARS
OF QUESTIONS

On January 6, 2017, Lee published his vision for SegWit and Lightning on Litecoin and Bitcoin. He emphasized transaction malleability, not simply additional block capacity, and discussed future cross-network payment possibilities. The essay was a proposal about what enabling technology might make possible; it was not evidence that all of those services already existed.

The distinction between an enabling change and a finished product is crucial. A protocol improvement can remove an obstacle while leaving wallets, routing, liquidity and operational reliability to be

built. The years that follow should be assessed through those individual outcomes, not through the ambition of an early diagram.

What makes the essay memorable is its cooperative posture. Litecoin could contribute practical experience while remaining a separate network. Our anniversary reading treats that as an invitation to evaluate experiments on their evidence. Taking a turn out front means accepting scrutiny as well as attention. It means documenting the result carefully enough that another project can learn from it, whether or not it makes the same choice.

THE TAKEAWAY

Lee framed Litecoin as a place to help advance shared technology.

[16] Charlie Lee: My Vision for SegWit and Lightning Networks on Litecoin and Bitcoin

APRIL 2017 • ORGANIZATION

A Foundation enters the story.

An institution can support a network without becoming the network.

The network came first; the organization supports its ecosystem.

On April 3, 2017, Xinxi Wang announced that the Litecoin Foundation had been incorporated in Singapore as a public company limited by guarantee. This is the historical incorporation record. It explains when a named organization entered a story that had already been running for more than five years.

The distinction between Foundation and protocol is essential. An organization can fund work, coordinate education, arrange events and provide a recognizable point of contact. That does not make it the owner of every Litecoin project or the authority behind every

transaction. The ecosystem includes independent developers, businesses, miners and users with their own responsibilities.

For a reader who wants to contribute, this separation is empowering. There can be a formal place to volunteer and donate, alongside permissionless work on documentation, software and local understanding. A mature anniversary can celebrate an institution's service while keeping its boundaries clear. The Foundation is part of Litecoin's capacity to organize; Litecoin itself remains a broader system of software, participants and independently made choices.

THE TAKEAWAY

An institution can support a network without becoming the network.

[17] Xinxi Wang: Litecoin Foundation is successfully incorporated

MAY 2017 · ACTIVATION

A proposal becomes a rule.

SegWit's journey distinguishes signaling, lock-in and activation.

A conceptual path from a proposed change to an active consensus rule.

LitecoinPool.org's April 28, 2017 notice recorded SegWit lock-in at the end of an activation period and identified the later activation boundary. Litecoin Core now records SegWit activation height 1,201,536. The public block record dates that height to May 10, 2017. These are separate milestones in a coordinated software change.

A signal is evidence of readiness or support in the specified mechanism. Lock-in establishes that the relevant threshold has been reached. Activation is when the new rules become effective under that

deployment. Compressing the three into a single announcement conceals useful information about how a public network changes.

The educational value goes beyond the acronym. Readers can ask the same sequence of questions about later upgrades: Which software contains the change? What triggers it? Has that trigger actually occurred? What must applications do afterward? Litecoin's SegWit episode belongs in the anniversary because it supplies a concrete example of technical coordination becoming a permanent part of a chain's history.

THE TAKEAWAY

SegWit's journey distinguishes signaling, lock-in and activation.

[18] LitecoinPool.org: SegWit locks in, will activate in two weeks [5] Litecoin Core chain parameters [19] SegWit activation-height block 1201536

NOVEMBER 2017 · EXPERIMENT

A bridge in the laboratory.

A documented cross-chain swap shows why the word testnet matters.

The November 2017 demonstration used test networks.

Lightning Labs announced a successful Lightning atomic-swap experiment between the Bitcoin and Litecoin testnets on November 16, 2017. The technical report describes exchanging assets on distinct chains through a coordinated payment construction. Its testnet setting is central to the claim, not a footnote to be dropped when the story is retold.

Atomicity means the designed exchange resolves together rather than leaving one party with only half of the agreed result. It does not mean every operational risk disappears, nor that a research demonstration establishes a widely available

commercial market. Implementation, liquidity and user experience still matter when turning a mechanism into a service.

This experiment deserves its place in the anniversary because it made an idea inspectable. Instead of a broad promise that all chains would connect, the team published a specific test and explained its structure. The best diagram for this page therefore keeps both ledgers visible, marks the experimental environment and shows the conditional path. A modest, reproducible claim can be more valuable than a sweeping one.

THE TAKEAWAY

A documented cross-chain swap shows why the word testnet matters.

[20] Lightning Labs: Connecting Blockchains - Instant Cross-Chain Transactions on Lightning

DECEMBER 2017 · DISCLOSURE

The founder and the holding.

A public statement raised an enduring question about influence and incentives.

“I will still spend all my time working on Litecoin.”

Charlie Lee / 2017-12-20 / Original record ↗

21

FIFTEEN YEARS
OF QUESTIONS

In December 2017, Lee published a Reddit statement saying he had sold or donated his LTC, apart from physical collectibles. He attributed the decision to concerns about the relationship between his public comments, influence and financial interest. He also said he intended to continue working on Litecoin. These are his disclosed account and stated reasons, not an independent audit of his finances.

An anniversary should include this episode without inventing a motive or turning it into a verdict on the entire network. Readers can reasonably examine incentives and still distinguish a founder's portfolio

from the operation of a public ledger. A claim about private holdings is also different from evidence about software maintenance or future adoption.

The larger editorial lesson concerns disclosure. Public advocates should explain relevant interests, and publications should preserve the distinction between a statement and verified underlying transactions. This page does not reconstruct sale prices, private balances or market impact. It records the statement, its context and the governance question it leaves for any community centered on a recognizable founder.

THE TAKEAWAY

A public statement raised an enduring question about influence and incentives.

[21] Charlie Lee / coblee: Litecoin price, tweets, and conflict of interest

2018 · MEETING IN PERSON

An internet community books a room.

The first Summit announcement gave Litecoin a physical gathering point.

A community map, not a roster of event attendees.

The Litecoin Foundation announced its first annual Summit for September 14-15, 2018 at the South San Francisco Conference Center. Its contemporary release described a gathering for the wider blockchain and cryptocurrency community as well as Litecoin participants. That announcement is the evidence used here; this page does not manufacture attendee testimony or an eyewitness scene.

Physical gatherings matter because software communities can otherwise encounter one another only as names, commits and messages. A conference creates space for questions that do not fit a release

note: how a wallet feels, why documentation is confusing, what a merchant needs and where a newcomer can contribute. Those are general possibilities of the format, not invented claims about a particular conversation.

The anniversary design treats the Summit as a community institution rather than a backdrop for celebrity. Its enduring value should be measured by work, relationships and learning that participants can actually describe. For future organizers, the task is to make those opportunities accessible, publish practical details and preserve a useful record after the stage lights go out.

THE TAKEAWAY

The first Summit announcement gave Litecoin a physical gathering point.

[22] Litecoin Foundation: First annual Litecoin Summit announcement

2019 / 2023 • THE NEXT EPOCHS

Smaller additions. Same unit.

Two more halvings extended the schedule across very different years.

Subsidy after each historical halving. Block issuance, not a price forecast.

The first halving arrived on August 25, 2015 at block 840,000, reducing the subsidy from 50 to 25 LTC. Contemporary mining-pool notices mark the second Litecoin halving on August 5, 2019 and the third on August 2, 2023. The subsidy moved from 25 to 12.5 LTC, then from 12.5 to 6.25 LTC. The Foundation's retrospective independently identifies the 2023 event and its completed subsidy change.

The comparison is most useful when the graphic uses block heights and subsidy units rather than selecting a price chart that flatters a preferred conclusion. The same programmed rule can operate

in different markets and business environments. Mining revenue is not determined by the Litecoin subsidy alone, particularly where compatible work also earns other-chain rewards.

For readers, a halving table is a compact lesson in separating known conditions from uncertain outcomes. The scheduled threshold is explicit. The future calendar date depends on block production. A market response remains contingent. This sequence is a story of monetary rules being exercised repeatedly, not a promise that the next event will reward a particular strategy.

THE TAKEAWAY

Two more halvings extended the schedule across very different years.

[23] LitecoinPool.org: Litecoin's Second Block Reward Halving [24] LitecoinPool.org: Litecoin's Third Block Reward Halving [25] Litecoin Foundation: 2023 - Litecoin's most prolific and exciting year
[26] Second halving block 1680000 [27] Third halving block 2520000 [129] LitecoinPool.org: Litecoin's First Block Reward Halving

FROM HISTORY TO THE NEXT CHAPTER

Privacy becomes a product question.

A mature currency has to consider what a payment reveals.

“I think financial privacy is a human right.”

Charlie Lee / 2024-08-01 / Original record ↗

24

FIFTEEN YEARS
OF QUESTIONS

The Foundation’s learning center published Charlie Lee’s remarks on financial privacy in August 2024. His compact statement provides a useful transition from Litecoin’s early years to its later work on optional confidential transactions. The quotation is taken from that dated publication; it is not a new interview for this issue.

The editorial question is practical. What should a recipient learn in order to accept a payment, and what unrelated information should remain outside that exchange? Answering it requires examining wallet behavior, network metadata, transaction

construction and the boundaries between transparent and confidential systems. A privacy feature cannot be evaluated responsibly through a single adjective.

The rest of this anniversary follows those boundaries into Litecoin’s current ecosystem. It asks what was released, what is proposed, what is optional and what a user must understand before relying on it. That is the bridge from celebration to service: a history worth honoring should equip its next readers to ask better questions, not require them to suspend judgment because the project has reached a milestone.

THE TAKEAWAY

A mature currency has to consider what a payment reveals.

[28] Litecoin Learning Center: Charlie Lee Quotes - About MWEB, Litecoin and Privacy

2017 / A SUPPORT INSTITUTION

The Foundation arrives

An open network acquired an organization that could do the patient work around it.

On April 3, 2017, Xinxi Wang announced the Litecoin Foundation's incorporation in Singapore as a public company limited by guarantee. Litecoin had already existed for years. That order matters: an organization came to support a network, rather than a network being a customer database owned by an organization. The announcement is a useful historical landmark, not a substitute for checking a legal registry today.

Read the issuer, date and legal entity separately.

The Foundation now describes its purpose through adoption, awareness and development. These tasks connect software to ordinary life: explaining an unfamiliar payment, helping a builder find an audience, and making technical work legible beyond a repository. Our editorial view is that a community becomes easier to join when those functions are visible. Supporting that work should not require confusing a Foundation announcement with a change in Litecoin's consensus rules.

A Foundation project is not automatically a consensus feature.

THE TAKEAWAY

Read the issuer, date and legal entity separately.

[29] Foundation incorporation announcement [30] Litecoin Foundation: mission and team [31] Litecoin Core README

FROM LITE.SPACE TO PROJECTS

Funding the unglamorous essentials

A project directory is most valuable when it exposes the work behind the pitch.

An editorial framework for reading development-funding proposals.

Lite.space's migration notice says its open-source Litecoin crowdfunding platform has moved to litecoin.com/projects. The current portal separates active initiatives from completed projects and gives individual efforts their own descriptions. This is different from LitecoinSpace.org, the blockchain explorer. Similar names should not collapse two very different jobs: funding development and observing the chain.

The portal also publishes Charlie Lee's donation-matching pledge. A pledge is a commitment described by its author, not proof that every possible donation is eligible or that a displayed counter reconciles to completed work. We reproduce no live fundraising total here. Our proposed funding lens starts with the deliverable: who maintains it, how a reviewer can reproduce the result, what remains unfinished, and where continuing costs sit after launch. A modest tool with a clear maintenance plan can be more useful than a grand promise with no acceptance criteria.

RELEASE DESK / SEPTEMBER 12, 2026

Read the release before the headline

The latest public Core release at this edition’s cutoff is v0.21.5.8.

A dated Litecoin Core software release, not an independent security audit.

The official release record checked October 4 lists Litecoin Core v0.21.5.8, published September 12, 2026. Its notes describe improvements to MWEB validation, transaction relay, mining and resource handling. They also incorporate changes from v0.21.5.7, a security build previously distributed to mining pools. The record is more informative than the version number alone because it explains which behaviors changed and why operators were asked to act.

One highlighted consensus rule rejects a particular empty extra-data encoding in MWEB kernels from a specified activation height. Other fixes concern revalidation during chain connection and handling invalid block variants. Those details are reminders that reliable money depends on awkward edge cases, not only elegant cryptography. This page records a dated release; it is not a guarantee that the same version will remain latest on October 15. Before operating software, consult the current official notes and verify the downloaded artifact through the project’s published process.

Recorded release: v0.21.5.8.

Check date: October 4, 2026; future changes remain unreported.

THE TAKEAWAY

Recorded release: v0.21.5.8.

[34] Litecoin Core v0.21.5.8 release

THE LIGHTNING EXPERIMENT

Small payments, new assumptions

The 2017 demonstration is a milestone, not a present-day capacity statistic.

Simplified payment-channel lifecycle. Availability and liquidity matter.

Blockstream's May 11, 2017 report describes Christian Decker making a Litecoin Lightning payment on May 10. Lightning Labs had already explained why Litecoin's approaching SegWit activation offered a place for early development. Together these primary accounts preserve a moment when a technical possibility became a demonstrated payment rather than simply a diagram in a paper.

The idea is to use channels so that not every payment update needs its own immediate base-chain transaction. That moves part of the user experience into liquidity, routing and channel management. A fast interface is therefore only one part of the story: the reader should also ask how a channel is funded, what happens when a peer disappears and how settlement returns to the chain. We make no claim about today's Litecoin Lightning node count, usable liquidity or universal wallet support. A historical first deserves celebration with its date still attached.

Demonstration date: May 10, 2017.

Channel usability depends on more than a block interval.

THE TAKEAWAY

Demonstration date: May 10, 2017.

[35] Blockstream: Lightning on Litecoin [36] Lightning Labs: Litecoin support in LND

MINING / THE MECHANISM

One stream of work. Separate chains.

Auxiliary proof of work lets compatible networks verify the same mining effort.

Conceptual flow; independent targets and chain rules. Arrow widths do not represent hashrate.

Picture a pool assembling several sealed envelopes. Each contains an auxiliary chain's proposed block.

The pool commits to those blocks inside the parent candidate, then sends the mining job to Script hardware. The hardware keeps searching; it does not divide into a separate machine for every coin.

When a result meets an auxiliary network's target, the pool submits that block with an AuxPoW proof. Dogecoin Core checks the commitment and its connection to the parent header. A result need not become an accepted Litecoin block to qualify for an auxiliary chain; each network applies its own target and consensus rules.

Hashing algorithm compatibility is necessary; auxiliary consensus support and pool integration are also required.

Dogecoin enabled AuxPoW through its 1.8 release in 2014. The relationship shares compatible work, not balances, monetary policies or governance. Litecoin does not become a Dogecoin validator, and neither chain inherits Bitcoin's SHA-256 security. More participating work can strengthen an auxiliary network's resistance to attack, but only work actually committed to that network counts. Pool concentration, software correctness and independent validation still matter.

Merged mining reuses work. Profit switching changes the primary coin being mined.

THE TAKEAWAY

Hashing algorithm compatibility is necessary; auxiliary consensus support and pool integration are also required.

[37] Dogecoin Core: AuxPoW validation [38] Dogecoin Core: auxiliary mining RPC [39] Mining Dogecoin [40] Dogecoin 1.8 release

MINING / THE DATED DIRECTORY

The Scrypt family has many branches

A checked pool catalog is useful. A universal promise of “all coins” is not.

Counts reflect the cited published lists checked October 4, 2026, not a ranking, income estimate or network total.

Published support checked October 4, 2026; no payout or chain-health test. BEL/BELLS identifies Bells.

Named auxiliary coins	Selected pool documentation
DOGE, BEL / BELLS, PEP, DINGO	Mining-Dutch / ViaBTC / F2Pool
LKY	Mining-Dutch / F2Pool
JKC, FLOP, NYC, TRMP, CRC	Mining-Dutch catalog
SHIC, EAC, WDC, BONC, B1T	Mining-Dutch catalog

Our October 4 survey found fifteen named auxiliaries in Mining-Dutch’s Scrypt merged-mining panel. The accompanying directory preserves the pool’s coin identities and distinguishes that advertised catalog from coins with independently tested payouts. We did not connect equipment or verify anyone’s earnings.

Read symbols carefully: Pepecoin PEP is not the PEPE token; Bells may appear as BEL or BELLS. The SHIC label in this catalog is not an Ethereum SHIB balance. Keep each chain, wallet and withdrawal network distinct. An advertised auxiliary list is also different from a pool’s entire Scrypt coin menu: a coin can be available for primary mining without being merged with Litecoin.

Dogecoin, Bells / Bellscoin, Pepecoin, Dingocoin, Luckycoin

Junkcoin, Floppcoin, NewYorkCoin, TrumPOW, Craftcoin

Shibalnucoin / Shibacoin, Earthcoin, Worldcoin, BonkCoin, B1T

Full coin and provider source directory ↗

THE TAKEAWAY

Dogecoin, Bells / Bellscoin, Pepecoin, Dingocoin, Luckycoin

[41] Mining-Dutch: Scrypt merged-mining panel [42] LTC Merged Mining Coins Mining Tutorial [43] App—merged mining guide

MINING / FOLLOW THE PAYOUT

A mined coin is not always your payout coin

Three accounting models can sit behind the same merged-mining label.

Accounting alternatives documented by different pools; these are not simultaneous guarantees for every miner.

Before comparing a pool's reward screen, ask what arrives in the wallet. LitecoinPool.org pays LTC and DOGE directly; it explains that smaller auxiliary coins support its PPS rates instead of being distributed individually. Kryptex's Litecoin page describes conversion of merged coins into LTC. A long list of mined chains therefore need not mean a long list of wallet deposits.

Other pools credit named assets separately. ViaBTC's tutorial describes account credit before a withdrawal address is prepared. F2Pool's guide says the corresponding auxiliary address must be configured

before those rewards start accruing; missing-address rewards are forfeited, not later recovered. These are materially different onboarding rules.

Mining-Dutch documents optional conversion and several reward modes. Its merged rewards follow the finder's selected mode, while D-PPS accounts for auxiliary work through share rates. For any provider, record the actual payment method, network, threshold, fees, maturity and withdrawal status. Reconcile accepted work, credited reward and settled payout separately. A pool dashboard balance is an operator's accounting record until the relevant on-chain payment is confirmed.

Direct asset payout ≠ automatic conversion ≠ inclusion in a share rate.

Preserve a dated copy of terms before relying on a payout setup.

THE TAKEAWAY

Direct asset payout ≠ automatic conversion ≠ inclusion in a share rate.

MINING / THE OPERATOR'S NOTEBOOK

Count costs. Track closures. Keep evidence.

More tickers do not automatically make a stronger mining business.

Illustrative accounting sequence, with no prices, yields or investment recommendation.

A useful operating ledger begins with accepted shares and ends with spendable receipts. Between them sit pool allocation, immature blocks, thresholds, conversion spreads and withdrawal availability. Alongside those receipts belong power, cooling, hosting, repairs, connectivity, hardware depreciation and any applicable obligations. Additional auxiliary revenue can help; it cannot erase these costs or guarantee a positive margin.

Lists also expire. ViaBTC ended LKY mining on June 8, 2026, and its SHIC/JKC asset-management notice set a May 19 end date. ANTPOOL’s July notice ended

TRMP, SHIC, CRC and JKC mining from July 10. CloverPool had already suspended CRC, DOGM, BONC and TRMP from November 27, 2025. A delisting at one pool does not establish that the underlying chain is dead.

For each chain, keep an evidence card: identity, software record, current pool support, payout rules, recent service notices and the date checked. Revisit it before changing equipment or routing work. A catalog entry is a research starting point; successful settlement and a defensible cost ledger are different tests.

Net operating result = realized receipts minus documented operating costs; equipment recovery is a further question.

No hardware purchase, pool connection, conversion or transaction was performed for this research.

THE TAKEAWAY

Net operating result = realized receipts minus documented operating costs; equipment recovery is a further question.

[39] Mining Dogecoin [47] Mining-Dutch: Help & Info [48] Announcement on the Discontinuation of LKY Pool [49] Announcement on the Discontinuation of SHIC and JKC Asset Management [50] ANTPOOL announcement index: TRMP, SHIC, CRC, JKC pool delisting [51] Notice on the Offline of CRC, DOGM, BONC and TRMP Mining Services by CloverPool

MWEB / THE OPTIONAL ROUTE

Confidentiality without replacing the whole road

Extension blocks let Litecoin support an additional transaction environment.

The Foundation's May 20, 2022 announcement reported MWEB activation at block 2,257,920. The feature is optional: ordinary transparent transactions remain available, while supporting wallets can use Mumblewimble Extension Blocks. Its development history combines the extension-block proposals with confidential-transaction techniques and Litecoin-specific usability work. The announcement date should not be mistaken for an independently reconstructed activation timestamp.

Optional feature; supported-wallet behavior matters.

Imagine a main road with a clearly marked entrance to another lane. Peg-in and peg-out connect the environments; upgraded validation enforces their relationship. This is a teaching diagram, not a separate custodial token wrapping service. The user's practical question becomes precise: does this wallet support the path I intend to use, and what information is visible at each boundary? That is a stronger starting point than assuming every Litecoin transfer is private simply because MWEB exists somewhere in the protocol.

Transparent transactions continue to exist.

THE TAKEAWAY

Optional feature; supported-wallet behavior matters.

[52] MWEB activation announcement [53] LIP2: Extension blocks

INSIDE THE EXTENSION BLOCK

What the public can verify without seeing

Confidential accounting still needs strict conservation rules.

Confidentiality and validation have different purposes. Conceptual model.

The MWEB design history describes commitments, transaction kernels and cut-through. A commitment lets a protocol reason about a hidden value without publishing that value in the ordinary way. A kernel preserves information needed to validate a transaction, while cut-through removes spent intermediate structure that is no longer needed in the same form. The original LIP documents remain labeled drafts; they explain design history and must not override current implementation details.

Threat model: what is hidden, from whom, and where?

Privacy has boundaries. A person may reveal a payment through an invoice, an exchange account, device compromise or their own public statements even when a protocol conceals an amount. This is why our illustration shows both the protected interior and the surrounding context. It is also why confidentiality and supply integrity must be evaluated together. Concealing a number cannot be allowed to excuse weak accounting, and a privacy feature should never be marketed as immunity from every observer or mistake.

Draft specifications are historical evidence, not current operating manuals.

THE TAKEAWAY

Threat model: what is hidden, from whom, and where?

[54] LIP3: Mimblewimble via extension blocks [53] LIP2: Extension blocks

THE RECORD MUST INCLUDE THE HARD DAYS

MWEB's 2026 security lessons

A credible anniversary preserves the repair history alongside the achievement.

A proposed incident-learning loop; read the actual postmortem and release notes.

David Burkett's April 28, 2026 postmortem describes a March validation flaw that permitted an inflated MWEB pegout, followed by coordinated containment, recovery and accounting repair. It also documents an April attempt that exposed a block-handling failure and led to a 13-block invalid chain being reorganized away. This is the developer's account; LTC Media has not independently reconstructed the chain events or audited every downstream loss.

Read the primary postmortem and subsequent release notes together.

The report says emergency response depended on miner coordination and several staged releases. It identifies v0.21.5.4 as addressing the April failure mode, while later release records document additional hardening. Our editorial conclusion is simple: discussing privacy honestly includes discussing validation, deployment and service integration. A chain can recover while particular services still experience harm. Neither celebration nor criticism should flatten those distinctions. The incident remains dated history here, not a claim that a new attack is underway at publication time.

Recovery claims do not establish that every service had zero loss.

THE TAKEAWAY

Read the primary postmortem and subsequent release notes together.

[55] David Burkett: MWEB security incident postmortem [34] Litecoin Core v0.21.5.8 release

WALLET SUCCESSION

From Litewallet to Nexus

A protocol becomes approachable through the small decisions on a phone screen.

A wallet transition has product, recovery and compatibility questions.

The Foundation announced Nexus for Android and iOS on June 6, 2025. The same notice scheduled Litewallet’s sunset for December 31, 2025 and pointed users toward the newer wallet. That makes “Litewallet” an important chapter in the ecosystem’s history, but not a name this edition should casually present as the Foundation’s newest supported application.

Nexus’s launch announcement brings several jobs into one interface: ordinary Litecoin use, optional MWEB and merchant-payment features. The

announcement is evidence of what its maker offered, not our own completed usability or regional-availability test. Our design lens is the handoff between confidence and understanding. A good wallet should explain which network a user is on, what a confirmation means and how recovery works without burying the essential choices under promotional language. This edition never asks readers to share a recovery phrase, and it does not infer custody or backup quality from an attractive app screen.

Launch announcement: June 6, 2025.

Legacy-app sunset was scheduled for December 31, 2025.

THE TAKEAWAY

Launch announcement: June 6, 2025.

[56] Nexus launch for Android and iOS

AT THE CHECKOUT

Spending is a complete journey

A gift card is a useful bridge to commerce - and an additional product with its own terms.

A proposed user checklist, not a tested payment or wallet instruction.

On May 28, 2026, the Foundation announced in-app gift-card purchases in Nexus. The update also describes Tor, manual coin selection and optional MWEB among the wallet’s capabilities. These are attributed product statements. We have not purchased a card, tested a retailer’s acceptance, or confirmed availability in every country.

The editorial opportunity is to show the entire journey rather than end the story at “pay.” A reader chooses a product, checks the quoted terms,

authorizes payment, receives a redeemable claim and uses it with a merchant. Each handoff has a different source of truth. Litecoin settlement does not by itself resolve gift-card expiry, regional restrictions, refunds or a merchant dispute. A clear payment experience makes those transitions visible. For a community trying to make digital cash ordinary, the receipt, recovery path and understandable support route can matter as much as the speed of the first tap.

Protocol settlement and merchant fulfillment are different events.

Check issuer terms and regional availability at use time.

CoinGate reports 14.4% Litecoin share of its 2025 crypto payments. This is one processor’s stated sample, not global commerce.

THE TAKEAWAY

Protocol settlement and merchant fulfillment are different events.

[57] Nexus gift-card update [108] CoinGate payment report: January-December 2025

SEEING THE CHAIN

An explorer is a window, not the sky

Litecoin Space makes transaction activity easier to inspect.

An explorer presents an indexed view. It is not the underlying network.

The Foundation's Litecoin Space listing describes a Litecoin adaptation of the Mempool Space explorer, including pending transactions, confirmed blocks and fee-market views. Its destination is [LitecoinSpace.org](https://litecoin.space). It is separate from [Lite.space](https://lite.space), the development-funding platform whose migration notice now points to the Foundation's project portal.

For a newcomer, an explorer can turn a mysterious transaction identifier into a readable sequence. For an expert, it is a useful second view against a local

node. In either case, the display has a source and a point in time. A mempool is an observer's collection of unconfirmed transactions, so two observers need not show an identical queue. Our suggested reading practice is to preserve the block height and observation time when citing a metric. This page carries no live fee estimate or network-capacity number; the illustration teaches how to inspect a display without pretending to be that display.

Pending is not confirmed.

Record source, time, height and definition before comparing metrics.

THE TAKEAWAY

Pending is not confirmed.

[58] Litecoin Space Mempool Explorer project [32] [Lite.space](https://lite.space) migration notice

KEYS AND DEVICES

Hardware changes where approval happens

The screen you trust is part of the security model.

A conceptual approval boundary. A hardware wallet does not remove all user risk.

The Foundation's wallet directory includes hardware and software options, and vendors such as Trezor maintain Litecoin support pages. A directory is a discovery tool, not certification that every model supports every Litecoin address type or MWEB workflow. Compatibility belongs to an exact device, firmware version and companion application.

Our conceptual model separates three jobs: constructing a transaction, checking its meaning and producing a signature. A dedicated signer can keep

sensitive keys away from a general-purpose computer, but the person still needs to understand what the device asks them to approve. Recovery is another system entirely: an intact device is not a substitute for a workable backup plan, and a backup phrase is not information to give a helper. A thoughtful setup makes both everyday use and a bad day understandable. No device was purchased, connected or used to sign anything for this edition.

Verify model, firmware and address support together.

A recovery phrase never belongs in a public contribution form.

THE TAKEAWAY

Verify model, firmware and address support together.

[59] Foundation wallet directory [60] Trezor Litecoin support

REUSABLE COMPONENTS

The Litecoin Development Kit

A library can let many interfaces share one carefully reviewed foundation.

A reusable toolkit can reduce repeated work without removing application responsibility.

The Foundation-listed Litecoin Development Kit describes descriptor-based wallet libraries derived from Bitcoin Dev Kit work, with native MWEB integration and language bindings. Its status statement is unusually valuable: it calls the work a public prototype and says independent review of the funds path is incomplete. It also explicitly distinguishes the project from Lightning Dev Kit, which shares the LDK abbreviation.

For readers outside software, a kit is a reusable set of parts. Instead of each app inventing its own transaction plumbing, teams can share tested components and spend more effort on the experience around them. The other side of reuse is shared exposure: a defect in a common component may reach several applications. Our proposed acceptance questions therefore focus on version pins, review scope, fixtures against reference implementations and clear upgrade instructions. The project's candid prototype label is part of its story, not something an anniversary spread should quietly remove.

Public prototype; independent funds-path review incomplete.

LDK here means Litecoin Development Kit.

THE TAKEAWAY

Public prototype; independent funds-path review incomplete.

[61] Litecoin Development Kit project

MWEB BEYOND ONE APPLICATION

LTCSuite and the light-client path

Reference work helps an ecosystem avoid solving the same hard problem repeatedly.

Related tools can make different trust and resource tradeoffs.

The Foundation's LTCSuite campaign describes MWEB integration initiated by Hector Chu and a reference implementation for light-client support. Its stated audience includes third-party wallet developers. The listing is evidence of the work's purpose and contributors; it does not certify that every downstream wallet has integrated it or that every planned feature is complete.

Interoperability is a demanding form of cooperation. Two implementations must agree not only on the happy path but also on malformed inputs,

synchronization and recovery. Our editorial view is that reference fixtures and reproducible edge cases are cultural infrastructure: they let people disagree precisely, then resolve the disagreement in code. This is less photogenic than a launch screen, yet it can determine whether a new payment feature reaches ordinary users reliably. A useful contributor story follows a test from failure to explanation to a reviewed repair, without claiming that passing tests alone amount to a comprehensive security audit.

Ask which version implements the feature.

Agreement on failure cases is part of compatibility.

THE TAKEAWAY

Ask which version implements the feature.

[62] LTCSuite MWEB campaign [63] Litecoin Core contribution workflow

DIFFERENT EXPERIMENTS, DIFFERENT ASSUMPTIONS

The wider workshop

Litecoin's application story is broader than any single virtual machine.

Selected ecosystem categories, not an exhaustive list or endorsement.

The Foundation directory includes Litecoin Computer, also known as Bitcoin Computer, whose project description uses JavaScript and client-side execution. It lists Ordinals Lite with indexing, explorer and command-line tools for digital artifacts. Stack Wallet appears as a separate open-source wallet initiative. These projects have different architectures and purposes; placing them on one page does not make them interchangeable or jointly audited.

Litecoin Computer is distinct from LitVM.

The interesting editorial question is what each project asks the base chain to guarantee and what remains an application convention. A chain can order transactions while an indexer interprets an artifact, or a client executes additional logic. That distinction matters more than the breadth of the word “smart.” This atlas is an invitation to inspect the individual repositories and their release records. It is not a claim that an inscription has investment value, that every feature is production-ready, or that a Foundation listing transfers responsibility away from a project's maintainers.

Application semantics and base-chain consensus are different layers.

THE TAKEAWAY

Litecoin Computer is distinct from LitVM.

[64] Litecoin Computer project [65] Ordinals Lite project [66] Stack Wallet project listing

THE BUILDERS · INDIGO NAKAMOTO

The interface is part of the commons

Making Litecoin easier to understand is infrastructure work.

A protocol can be open while its explanations remain difficult to find. Indigo's work addresses that distance. The Litecoin Foundation lists him as its applications developer for Projects/Chat, and its Knowledge Hub project credits him as a contributor. The repository describes retrieval from a curated knowledge base: an attempt to bring a reader's question closer to the documents that can answer it.

For Satnam Satoshi, the useful lesson is editorial as much as technical. We propose a source drawer beside each explanation: the original document, its date, what it supports and what remains unknown. A

Credit the author.

Keep uncertainty visible.

newcomer should be able to ask a plain question; an experienced reader should be able to inspect the evidence underneath.

That is a proposed direction, not an integration announcement. The chat repository carries noncommercial, attribution and share-alike conditions, with separate commercial terms. We can credit and link the existing work now; copying it into LTC Media requires the appropriate rights and an independent implementation review. Good collaboration begins by respecting the builder.

Open the source.

THE TAKEAWAY

Credit the author.

[67] Litecoin Foundation: core team [68] Litecoin Knowledge Hub project [69] Litecoin.com-Chat README at reviewed revision [70] Litecoin.com-Chat commercial licensing terms

THE BUILDERS · INDIGO NAKAMOTO

Observe first. Integrate deliberately.

A research desk and a wallet deserve different admission tests.

Proposed integration gates. Advancing one step does not imply approval for the next.

Litecoin Research Kit, Indigo's fork of Bitcoin Research Kit, combines chain indexing and analytical views around a Litecoin Core node. Its repository identifies litview.space as a hosted instance and includes an MIT license. That makes it a candidate for a future read-only research desk, with upstream attribution preserved. A chart still needs its definition, observation time and reproducible source; a polished screen cannot provide those by itself.

Wallet software belongs behind a higher gate. The Foundation's Litecoin Development Kit page describes a public prototype and says independent

review of the funds path is unfinished. The repository's reviewer guide documents both its approach and remaining gaps. Those records are useful precisely because they let another engineer challenge the work.

Our proposed sequence is simple: link the existing explorer, evaluate a small set of read-only observations, then study wallet interfaces using test fixtures and no funds. No keys, signing or transfers belong in the magazine. Celebrating a contributor's ambition does not require calling every experiment production-ready.

Analytics: provenance before publication.

Wallets: review before real value.

THE TAKEAWAY

Analytics: provenance before publication.

[72] LRK MIT license

[73] Litecoin Development Kit: public prototype and review needs

[74] Litecoin BDK reviewer guide

THE READING ROOM · MASTERBTCCLTC

A bookshelf for the curious

Community books can open a conversation without closing the inquiry.

Original reading guide. Typographic book cards are editorial labels, not reproductions of verified book covers.

The Other Bitcoin: Why Litecoin Is Hiding in Plain Sight brings a community voice to the bookshelf. In his own Look Into Litecoin announcement, masterbtcltc describes writing that began in 2022 and a personal journey through Bitcoin, Litecoin and encounters with Charlie Lee. The publisher's shop lists the book. Those records support an author spotlight; they do not substitute for reading and evaluating the complete text.

The founder also supplied an Amazon listing for Litecoin Is a Better Bitcoin: 13 Reasons and an expected October 15, 2026 release. At our October 4

research cutoff, that listing's title, author metadata and release date could not be independently retrieved. We present it as a forthcoming title supplied for this edition, with publication details still awaiting verification.

Read advocacy actively. Mark the difference between memoir, a technical claim and an investment argument. Follow references back to code and dated records. Claims about Satoshi's identity remain speculation. This reading room offers discovery and questions, not a full-book review, author endorsement or purchase recommendation.

The Other Bitcoin: publisher-confirmed title and author voice.

13 Reasons: founder-supplied forthcoming listing; date unverified.

THE TAKEAWAY

The Other Bitcoin: publisher-confirmed title and author voice.

[75] The Other Bitcoin: Why Litecoin Is Hiding in Plain Sight — author announcement

[76] The Other Bitcoin paperback — publisher shop

[78] Litecoin Is a Better Bitcoin: 13 Reasons — founder-supplied listing (metadata unverified)

COMMUNITY VOICES · WITH THANKS

Many hands, one public record

A birthday belongs to the people who keep showing up.

Illustrative forms of contribution, not a ranking, employment chart or exhaustive contributor list.

The visible story begins with Charlie Lee, but a useful anniversary also notices the continuing work. The Foundation's public team page identifies David Burkett with Litecoin and MWEB development, Loshan T. with Litecoin development, David Schwartz with strategic partnerships, and Indigo with Projects/Chat applications. Different kinds of service make a network easier to build on, explain and use.

The community's own records add texture. The Foundation credits Loshan's work on the Litecoin Space explorer port and names the supporters who helped its bounty. David Schwartz's Proof of Work

Code, education and coordination all count.

Summit profile links his public voice to @DaddyCool1991. Master contributes a different form of participation through Look Into Litecoin and his writing. These are acknowledgments of documented roles, not appointments to this magazine.

Our thanks extend to maintainers, translators, reviewers, educators, node operators and volunteers whose names cannot all fit here. Recognition should leave room for correction and avoid a leaderboard of human worth. No person named on this page has been represented as endorsing Satnam Satoshi or approving this edition.

Acknowledgment is not affiliation.

THE TAKEAWAY

Code, education and coordination all count.

[67] Litecoin Foundation: core team [79] Bounty: port Mempool.Space to Litecoin [80] David Schwartz speaker profile and public X link

[75] The Other Bitcoin: Why Litecoin Is Hiding in Plain Sight — author announcement

REVIEW IS A PUBLIC GOOD

Security funding and useful AI

The next useful contribution may be a better question - or a test that fails.

AI can assist review; an AI-produced answer is not evidence of correctness.

The Foundation's Core security-bounty page describes a funding pool but says scope, reporting instructions and eligibility must be published before bounty submissions are accepted. That is a meaningful readiness boundary. A researcher should not infer permission to test a live service simply because a fundraising page exists.

Another listed effort, the Litecoin Knowledge Hub, describes a retrieval-based AI tool grounded in a managed knowledge base, with integration work still

presented as part of the campaign. We have not tested its answer accuracy. Our editorial standard is that retrieval can improve access to evidence without making mistakes impossible: readers still need sources, dates and a correction route. Security researchers, maintainers and educators perform different jobs, but all benefit from a clear record of what was checked. This is also the rule for our own AI-prepared magazine: automated checks are useful, and they must never be relabeled as independent human review.

Bounty funding does not equal open testing authorization.

Source-grounded AI still needs checking and corrections.

THE TAKEAWAY

Bounty funding does not equal open testing authorization.

[81] Litecoin Core security bounty pool [82] Litecoin Knowledge Hub project

APRIL 17, 2026 / TESTNET

Meet LiteForge

A place to experiment is valuable precisely because it is not a production claim.

LitVM announced LiteForge on April 17, 2026 as its testnet. The project's documentation checked October 4 still identifies mainnet as coming soon, with its launch date to be determined. That is the status this edition preserves. A test environment lets developers explore a Litecoin-focused application design; it does not establish real-asset liquidity, production resilience or a completed security review.

The project aims to welcome developers familiar with Ethereum-style tooling. For a Litecoin reader, the first conceptual adjustment is that an EVM application

environment introduces accounts, contracts and execution rules beyond an ordinary base-chain payment. A familiar ticker or wallet interface should not erase those differences. Our suggested first exercise is entirely observational: read an example transaction, identify its network and explain what changed. This edition has not connected a wallet, requested faucet tokens or treated testnet balances as money.

Announced testnet: April 17, 2026.

Mainnet: TBD in documentation checked October 4.

THE TAKEAWAY

Announced testnet: April 17, 2026.

[83] LitVM: Welcome to LiteForge [84] LitVM network parameters

READ THE ARCHITECTURE IN LAYERS

Four jobs behind one interface

Execution, ordering, proving and settlement answer different questions.

Four architecture questions; a conceptual map of the project documentation.

LitVM’s architecture documentation describes Arbitrum Nitro for EVM-compatible execution, Succinct SP1 for validity proofs and Espresso for transaction ordering. It presents a hybrid rollup design, with bridging and settlement handled through additional components. These are project-described architectural choices; LTC Media has not audited their deployment or benchmarked the claimed performance.

The separation is useful even to a nondeveloper. Execution asks what a transaction does. Ordering decides which transaction comes first. Proving

supplies evidence that a computation followed the rules. Settlement determines where the resulting state becomes authoritative. A strong implementation has to make the connections between those jobs reliable as well as make each job work. Our diagram therefore uses four labeled layers and explicit boundaries. It deliberately avoids a single arrow marked “secured by Litecoin,” because that phrase would hide the distinct assumptions readers need to assess.

Architecture description $\neq$ deployment audit.

Ask where the authoritative state lives in the current phase.

THE TAKEAWAY

Architecture description $\neq$ deployment audit.

[85] LitVM architecture and phases [86] Arbitrum: Inside Nitro [87] Succinct: SP1 introduction [88] Espresso Network concepts

THE BRIDGE IS A SYSTEM

LTC, zkLTC and the return path

A representation of an asset adds a mechanism that readers should understand.

A simplified claim-and-redemption map. Bridge assumptions remain material.

LitVM’s BitcoinOS documentation describes Grail bridging and an optimistic challenge process with a one-honest-verifier assumption. Its token documentation distinguishes zkLTC, a proposed LTC-backed representation used for gas and applications, from the separate LITVM governance and utility token. Those labels describe different roles; neither should be silently substituted for native LTC.

Our analytical checklist follows the return path.

What proves a deposit, who can challenge an invalid claim, how long can an exit take, and what happens

Native LTC, zkLTC and LITVM have distinct roles.

if a required participant is unavailable? “One honest verifier” is an assumption to examine, not an absence of assumptions. Likewise, backing is not the same question as immediate redeemability under every failure condition. We report the project’s design without adopting its strongest marketing assurances as independent conclusions. Testnet examples and proposed token economics are not an invitation to bridge funds or an assertion that a production token launch has occurred.

Inspect exit and challenge conditions, not only the deposit screen.

THE TAKEAWAY

Native LTC, zkLTC and LITVM have distinct roles.

[89] LitVM: BitcoinOS technology [90] LitVM token roles

A ROADMAP IS A SEQUENCE OF GATES

Anchoring is not settlement

The proposed destination should never be confused with the present phase.

Publishing a commitment is not itself proof that Litecoin enforces another system.

The published architecture lays out three mainnet phases: initial Ethereum settlement with bridges, later proof anchoring to Litecoin, and a final target of native Litecoin settlement. Those stages are a roadmap. As of the October 4 documentation check, this edition does not have evidence that the production sequence has been completed.

The middle step deserves particular care. Recording evidence on a chain can make an audit trail durable without automatically making that chain responsible

for every rule of the external system. Our interpretation is that readers should ask what a Litecoin node actually verifies at each phase, rather than treating the presence of a recorded proof as a universal guarantee. Good roadmaps can invite accountability: identify the deliverable, the observable acceptance condition and the dependency that could delay it. A celebratory magazine can display that ambition beautifully while keeping future-tense verbs intact.

Phase 1: Ethereum settlement. Phase 2: Litecoin anchoring.

Phase 3 target: native Litecoin settlement; completion unverified.

THE TAKEAWAY

Phase 1: Ethereum settlement. Phase 2: Litecoin anchoring.

[85] LitVM architecture and phases [84] LitVM network parameters

PRIVACY BEYOND ONE MECHANISM

The Web3 privacy proposal

A shared aspiration does not make two privacy systems the same system.

A roadmap sequence, not completed production capabilities.

On August 26, 2026, LitVM announced a Web3 privacy initiative and identified SilentSwap among its intended participants. The article describes planned support for LTC and zkLTC. Separately, its BitcoinOS documentation labels MWEB integration as planned. These are useful leads for future reporting, not evidence that a complete production privacy route is already available.

MWEB protects a particular transaction environment within Litecoin's protocol. An application-layer privacy service must explain its own assets,

counterparties, metadata and cross-chain dependencies. Our proposed comparison begins with the observer: what can a merchant see, what can a network provider infer, and what can an application operator retain? A diagram of layered curtains is more honest than an invisibility cloak. This edition neither promises anonymity nor equates an announced integration with a tested service. The next milestone worth reporting is verifiable implementation evidence with an exact version and a documented threat model.

Announcement date: August 26, 2026.

Planned integration is not verified production capability.

THE TAKEAWAY

Announcement date: August 26, 2026.

[91] LitVM Web3 privacy initiative [89] LitVM: BitcoinOS technology

THE DEVELOPER'S READING ROOM

Compatibility still needs homework

Familiar tools can carry unfamiliar assumptions.

An editorial diligence path for compatibility claims.

LitVM's EVM-differences guide documents variable block production and warns that Solidity's block.number reflects an approximate Ethereum-layer number rather than the LitVM block number. It also warns against using block hashes as secure randomness and separates execution cost from data-posting cost. These details are more useful to a builder than a broad promise that a contract can simply move unchanged.

The project FAQ checked for this edition describes audits as in progress and mainnet after token-generation and audit milestones. Our readiness

framework is therefore deliberately concrete: a versioned implementation, public review scope, reproducible tests, clear upgrade powers and an understood exit path. No single badge answers all five questions. An anniversary can welcome ambitious experiments while insisting on that clarity. The Litecoin family grows stronger when newcomers can tell a live protocol feature, a released application, a prototype and a roadmap apart without already being experts.

Check block semantics, fees and randomness assumptions.

Audit status in the FAQ: in progress at October 4 cutoff.

THE TAKEAWAY

Check block semantics, fees and randomness assumptions.

[92] LitVM EVM differences [93] LitVM FAQ

CHAPTER THREE / ORIGINAL EDITORIAL FRAMEWORK

When the network meets the institution

A different vocabulary, the same obligation to verify.

At a trading desk, Litecoin becomes more than a ticker. It is an asset held through a chain of operational decisions: which legal entity is the counterparty, how keys are controlled, what price is used for valuation and what happens when a service stops working. None of those questions disappears because the underlying ledger is public.

This chapter is an editorial framework for reading institutional materials. It is not a recommendation to buy LTC, a fund or a treasury-company share. The products discussed have different rights, costs and risks. A familiar brokerage interface can make access easier while introducing a new layer of dependence.

The strongest case for taking a network seriously is a willingness to examine it precisely. Compare structures before comparing returns. Keep dates next to numbers. Ask whether a statistic describes the whole network, one service provider or one security. Treat the document that defines an investor's rights as more important than the adjective on its cover.

An anniversary can celebrate open access while insisting on professional standards of evidence. That is the ambition of this notebook.

THE TAKEAWAY

A different vocabulary, the same obligation to verify.

THE INSTITUTIONAL NOTEBOOK

One asset, different claims

LTC, a fund share, a debt security and company equity are not interchangeable.

These instruments have different rights. They are not interchangeable units.

A person holding native LTC under their own keys can authorize a transaction on Litecoin, subject to the network's rules. A holder of an exchange-traded security instead owns the rights described by that security's documents. A shareholder in a treasury company owns equity in a business, with liabilities, expenses and managerial decisions between them and its assets.

These distinctions are not a ranking of investors. They are a map of responsibility. Direct ownership requires operational competence. A custody service

Native LTC / authority to spend an on-chain asset

Treasury equity / a residual claim on a business

introduces contractual and operational dependence. A product can offer familiar reporting and brokerage access, but it may have fees, limited redemption rights or a market price that differs from its underlying value.

Start a comparison with four questions: what do I legally own, who controls the keys, how can I exit and what can dilute or reduce my claim? Only then compare convenience, cost or performance. The same three letters on a product description do not make its holder a Litecoin network participant.

Fund or ETP / a documented claim on a vehicle

THE TAKEAWAY

Native LTC / authority to spend an on-chain asset

[94] Canary Litecoin ETF prospectus [95] CoinShares Litecoin ETP: product structure and identity [96] Grayscale Litecoin Trust: annual report, year ended June 30, 2026

THE INSTITUTIONAL NOTEBOOK

The LTCC passport

Read a product identity before reading its marketing.

Product identity only; no current price, holdings or trading-volume claim.

Canary's Litecoin product gives a concrete example of brokerage-based exposure. The issuer identifies the Nasdaq ticker as LTCC. Its documents describe a vehicle intended to follow the price of LTC held by the trust after expenses and liabilities, rather than a strategy designed to outperform Litecoin.

The useful institutional exercise is to assemble a passport: legal name, identifier, listing venue, sponsor, custodian, administrator, fee schedule and governing prospectus. Save the effective date of each document. These details can change independently; a marketing page is not a substitute for the full terms.

There is also a practical data lesson. The retrieved product page contained a conflicting inception-year footnote. This edition does not promote that inconsistency into a verified chronology or repeat its displayed prices as current. We use the product's documented identity and link the source so the reader can inspect it.

Access is a milestone. A clean chain of documentation is how a serious investor evaluates what that access actually provides.

Ticker / LTCC

Venue stated by issuer / Nasdaq

Role in this edition / product case study, not an allocation

THE TAKEAWAY

Ticker / LTCC

[97] Canary Litecoin ETF: product and dated disclosures [98] Canary announces the LTCC product

THE INSTITUTIONAL NOTEBOOK

Grayscale. Keep every date.

A trust history is not a promise about its next listing.

≈1,956,420 LTC

OCT 02, 2026

Calculated product fields

24,252,100 shares × 0.08067013 LTC/share, rounded to whole LTC. Not flows or a custody audit.

Grayscale Litecoin Trust's annual report, filed September 3 for the year ended June 30, 2026, identifies OTCQX trading under LTCN. It records a proposed offering and NYSE Arca listing that had not become effective as of that filing. The September 11 preliminary conversion amendment is discussed on the next page.

A Grayscale-branded product workbook linked by Litecoin Register reports 24,252,100 shares and 0.08067013 LTC per share dated October 2. Multiplying those rounded inputs gives approximately 1,956,420 LTC. That is a calculation

from product fields, not an exact custody attestation. Register displays the rounded quantity with an October 4 date; the workbook observation keeps its October 2 date here.

The annual report separately records 1,969,057.14487396 LTC as of June 30. These observations are neither a flow series nor proof of a later ETF conversion. Trust structure, expenses, trading price and redemption arrangements still matter. A premium or discount is a market relationship to inspect, not a promise that it will close.

THE TAKEAWAY

The tracker's check date cannot refresh an older underlying observation.

[96] Grayscale Litecoin Trust: annual report, year ended June 30, 2026 [99] LTCN preliminary S-3/A amendment [132] Grayscale Litecoin Trust product-performance workbook
[138] Litecoin Register: Grayscale Litecoin Trust [102] Grayscale fiscal-2026 annual report

INSTITUTIONAL NOTEBOOK / LTCN

Read the future tense.

LTCN's proposed conversion is a dated filing story, not a verified launch.

Original conceptual guide; proposed roles and processes are not completed activity.

Grayscale's September 11, 2026 S-3/A describes a proposed rename to Grayscale Litecoin Trust ETF and a NYSE Arca listing under LTCN. Its preliminary prospectus keeps effectiveness and the contemplated offering conditional. The words proposed, intended and effective do different jobs.

The procedural trail also contains a withdrawal. The SEC marks the earlier product-specific NYSE Arca docket withdrawn on September 29, 2025, after it approved generic standards for qualifying

commodity-based trust shares on September 17. That sequence does not, by itself, establish an LTCN launch, denial or abandonment.

The annual report filed September 3, 2026 describes the trust at June 30. The later amendment describes a contemplated structure. Neither is an October 4 price, NAV or flow observation. Our selected-record review did not verify a final prospectus, effectiveness event and trading notice establishing conversion. Readers can inspect the expanded timeline in the companion room; this is not a claim to have inventoried every later filing.

Expanded LTCN timeline ↗

THE TAKEAWAY

LTCN's proposed conversion is a dated filing story, not a verified launch.

[99] LTCN preliminary S-3/A amendment [100] SEC docket SR-NYSEARCA-2025-05 [101] SEC generic listing standards [102] Grayscale fiscal-2026 annual report

INSTITUTIONAL ACCESS / FIDELITY

Fidelity opens a door.

Trading and custody support bring Litecoin to another familiar interface.

Service support checked October 4, 2026; not an ownership estimate or ETF claim.

Fidelity's official Crypto help pages list Litecoin among the assets customers can buy and sell. They identify Fidelity Digital Assets, NA as the custody and trading service provider and document deposits on Litecoin's main network, subject to service availability and account conditions.

That is evidence of access, not a published inventory of coins. The reviewed pages do not establish a Fidelity Litecoin ETF, a proprietary corporate LTC treasury or an aggregate client LTC balance. A company supporting an asset and a company owning that asset for its shareholders are different stories.

Verified role / LTC trading and client custody support

Keep distinct / Service access, investment products and corporate reserves

For a newcomer, the familiar name can make an unfamiliar asset easier to approach. The operational questions remain: who holds the keys, which transfers are supported, what restrictions apply, and what happens when a customer wants to leave? Main-network deposit support does not, by itself, confirm MWEB compatibility.

Our institutional map therefore gives Fidelity its own category: platform access and client custody. No missing quantity becomes zero, and no unreported balance is added to the holdings table.

Reviewed LTC balance / Not disclosed

THE TAKEAWAY

A supported asset is not the same thing as a disclosed balance.

[130] Fidelity Crypto account basics [131] Depositing crypto

THE INSTITUTIONAL NOTEBOOK

A futures contract is a different instrument

The calendar, margin and settlement rules enter the story.

A futures contract has obligations distinct from holding native LTC.

On March 7, 2024, Coinbase Derivatives submitted a Litecoin futures contract for self-certification, describing an intended listing on or after April 1, 2024. The filing is evidence of the submitted contract and intended timetable. It should not be stretched into a claim about today's liquidity, open interest or a particular investor's access.

A futures position is a contractual exposure with its own settlement and margin rules. Its price can differ from spot LTC. Leverage changes how a price movement affects the capital supporting a position,

and an investor may face demands for additional collateral before a long-term thesis has time to play out.

For readers mapping Litecoin's institutional history, derivatives demonstrate another way market participants can express or manage exposure. They do not create additional native LTC or make the protocol itself a leveraged product.

Keep the instrument's rulebook beside the network's rulebook. One describes a traded contract; the other describes which transactions Litecoin nodes accept.

THE TAKEAWAY

The calendar, margin and settlement rules enter the story.

[103] Coinbase Derivatives: Litecoin futures self-certification

THE INSTITUTIONAL NOTEBOOK

A treasury company enters the picture

One issuer's dated balance-sheet story.

Lite Strategy issuer-reported holdings date, followed by the announcement date.

Lite Strategy’s September 29, 2026 results announcement reports 832,716 LTC as of June 30. A separate July 30 SEC-filed release reports 819,070 LTC as of July 17. The later publication describes the earlier balance-sheet date. Preserve both clocks rather than choosing a figure because its headline was published more recently.

These are distinct issuer-reported historical balances, not an October 4 reconciliation or a record of flows. The company describes a treasury strategy, custody, asset management and share repurchases. Its equity

also reflects operating costs, capital structure, obligations and management decisions. A coin count alone cannot establish common-share value.

Use the dated holdings figure as a starting point for questions: which assets are restricted or pledged, what liabilities sit ahead of common equity, how many shares are relevant and when was each input measured? Read the filed financial statements before attempting a valuation.

An anniversary issue should record institutional participation without converting an issuer's aspirations into the publication's promise of returns.

832,716 LTC / June 30 balance; September 29 release

819,070 LTC / July 17 balance; July 30 release

Two reporting dates / No current balance or inferred flow

THE TAKEAWAY

Read the balance date and the publication date separately.

[104] Lite Strategy: fiscal 2026 financial results [133] Lite Strategy repurchase update, Exhibit99.1

THE INSTITUTIONAL NOTEBOOK

The denominator matters

An illustrative mNAV calculation, not a company valuation.

$\$50,000 \text{ LTC} + \$10,000 \text{ cash} - \$5,000 \text{ debt}$

$\$55,000 \text{ illustrative net assets}$

$\$66,000 \text{ equity} / \$55,000 \text{ NAV} = 1.20x$

Fictional teaching assumptions. This is not an issuer valuation or live market data.

Imagine a fictional company with 1,000 LTC valued at an assumed \$50 each, \$10,000 in cash and \$5,000 of liabilities. Under this deliberately simple equity-NAV definition, net assets would be \$55,000. If its hypothetical market capitalization were \$66,000, the ratio would be 1.20 times that NAV.

Nothing on this page is a live market input or a valuation of Lite Strategy or another issuer. The exercise shows why the definition matters. Enterprise-value approaches, restricted assets, derivative exposures, preferred claims, dilution and

valuation timestamps can change the result. Two dashboards can publish different ratios while using different denominators.

An analyst should state the formula before the number and reconcile the inputs to the same date. A premium is not automatically a signal to buy or sell. It may reflect expectations, access, risk, liquidity or a mistake in the data.

The productive question is not which ratio is most flattering. It is whether another reader can reproduce the calculation and understand what was left out.

Fictional net assets / $1,000 \times \$50 + \$10,000 - \$5,000 = \$55,000$

All inputs are teaching assumptions; no trade is proposed.

Fictional ratio / $\$66,000 \text{ divided by } \$55,000 = 1.20x$

THE TAKEAWAY

Fictional net assets / $1,000 \times \$50 + \$10,000 - \$5,000 = \$55,000$

THE EVIDENCE DESK / OCTOBER 4 SNAPSHOT

The institutional roll call.

Six names, several clocks. A useful table keeps the differences.

A change in holdings alone does not identify net investor flows.

All dates 2026. Selected snapshot checked October 4; issuer disclosures are not independent custody audits.

Entity	Register / LTC & date	Admitted source / LTC & date	Evidence status
Grayscale · LTCN	1,956,420 · Oct 04	≈1,956,420 · Oct 02	Calculated from rounded product fields
Canary · LTCC	214,107 · Oct 04	Withheld at cutoff	Issuer holdings table says Oct 05
Lite Strategy · LITS	819,070 · Jul 17	819,070 · Jul 17	Issuer-reported historical balance
CoinShares · LITE	151,145 · Aug 31	151,145.1820 · Aug 31	Stale reserve field; warning flag
Bitwise · ELTC	93,071 · Oct 04	93,070.70 · Oct 04	Issuer page; tracker rounds
Luxxfolio · LUXX	25,288 · Oct 04	25,017.721481 · Sep 28	Later tracker figure unreconciled

The Register column reproduces selected tracker observations. The source column shows the underlying evidence admitted by this edition’s October 4 cutoff. Every quantity is LTC, with its own effective date. The figures are not a synchronized ownership census.

Grayscale is an approximate calculation; CoinShares carries a stale warning; Canary’s future-dated issuer quantity is excluded. Luxxfolio’s later tracker value remains unreconciled. No aggregate is calculated: product reserves, corporate treasuries and custodial balances can overlap. Holdings changes are not ETF flows.

Fidelity: verified LTC service access, no reviewed public balance (page 59).

European ETP listings share product identities; do not count exchange tickers as separate reserves.

Full snapshot and source notes ↗

THE TAKEAWAY

Keep the date, the category and the evidence status beside the number.

THE INSTITUTIONAL NOTEBOOK

Custody is a system of responsibilities

A public ledger cannot tell you who has authority inside a company.

Illustrative separation of duties, not a certification of any custodian.

A well-designed custody process begins with roles: who proposes a transfer, who reviews it, who can authorize it and who can restore operations after a loss of access? Those answers live partly in technical controls and partly in human procedures. A brand name or a reserve address cannot replace them.

For an institution, separation of duties can reduce the chance that one compromised person or device controls the entire process. Recovery procedures need testing, documented ownership and a way to

remove access when staff change. Monitoring needs to distinguish an expected transfer from an unauthorized one.

For an individual, the same questions take a smaller form: where is the backup, who understands the recovery plan and what information should never be shared? This publication never asks readers to reveal keys or recovery words.

These are general operating principles, not a certification of any provider. Choosing a custody arrangement means choosing which responsibilities to perform directly and which to place under a contract.

THE TAKEAWAY

A public ledger cannot tell you who has authority inside a company.

POLICY / SEC & CFTC

SEC & CFTC: read the verb.

Two regulators, different responsibilities—
and several kinds of official document.

Different legal and evidentiary categories, not equivalent forms of approval. U.S. scope; source check October 4, 2026.

The SEC oversees federal securities laws; the CFTC's central remit is U.S. derivatives markets. Their March 2026 crypto-asset document combines an SEC interpretation with CFTC guidance. It is not a merger of the agencies or a substitute for reading the rules governing a particular product.

Issued March 17 and effective March 23, the interpretation includes Litecoin among its digital-commodity examples. That statement concerns the asset classification discussed in the release. It does not automatically settle the treatment of every

investment arrangement, lending service, wrapper or transaction involving LTC. The document separately addresses when a non-security asset can be involved in an investment contract.

The SEC's Corporation Finance staff then issued FAQs on September 25 and updated them September 28. Their stated status matters: staff views do not themselves amend law or impose new obligations. Keep the interpretation, staff explanation and the underlying statute distinct when evaluating a policy headline.

Commission interpretation: issued March 17; effective March 23, 2026.

LTC classification is not approval of every LTC-related product.

SEC staff FAQ: September 25; updated September 28, 2026.

THE TAKEAWAY

LTC classification is not approval of every LTC-related product.

[122] SEC Mission [123] The Commission [106] SEC interpretive release: crypto assets and transactions [124] Release 33-11412: crypto-asset interpretation and CFTC guidance
[107] SEC crypto-asset interpretation FAQs

WASHINGTON / THE PUBLIC RECORD

A vote is not a law.

Follow what happened, which institution acted, and the status of the result.

Legislation and agency guidance are distinct processes. The September 15 vote did not complete the legislative path.

September 15: Senate vote 234 rejected cloture on the motion to proceed to H.R. 3633, the Digital Asset Market Clarity Act. The official summary records 49 yeas, 50 nays and one senator not voting, against a three-fifths requirement. This was a procedural decision about advancing consideration—not final passage, enactment or a vote on Litecoin’s network rules.

September 24: CFTC release 9303-26 announced staff FAQ updates concerning registrants’ and registered entities’ crypto and blockchain activities. The update addresses customer-fund investments in

tokenized forms of permitted investments and blockchain-based recordkeeping. Its audience and subject are narrower than a blanket permission for public crypto products.

A durable policy reading starts with those distinctions. House and Senate passage in identical form precedes presidential consideration; a staff update follows another route and cannot stand in for enactment. Track the bill text, recorded action and document status. These records establish actions on their stated dates, not anyone’s motives, a future outcome or an investment signal.

September 15: procedural cloture motion rejected; no enactment by this vote.

September 24: CFTC staff FAQ update; scoped to named regulated activities.

Cutoff: October 4. No October 15 outcome is asserted.

THE TAKEAWAY

Cutoff: October 4. No October 15 outcome is asserted.

[126] Senate roll call vote 234: cloture on the motion to proceed to H.R. 3633
[125] CFTC Staff Releases Updates to FAQs Concerning Registrants and Registered Entity Activities Relating to Crypto Assets and Blockchain Technologies [127] The Legislative Process: To the Senate
[128] The Legislative Process: To the President

THE INSTITUTIONAL NOTEBOOK

A wrapped coin adds another map

cbLTC is a claim with a network and an issuer.

Simplified custodial claim. A wrapper does not create a second reserve asset.

Coinbase describes cbLTC as a token backed one-for-one by LTC held by Coinbase. Its help materials identify cbLTC on Base. The native asset and the wrapped token therefore inhabit different systems: Litecoin records LTC, while another network records the token representing a custodial claim.

This can make Litecoin-linked exposure usable in applications outside the native network. It also adds questions. What are the issuer's terms, supported jurisdictions and redemption arrangements? What

happens if the destination chain, token contract, application or custodian fails? A one-for-one backing statement does not remove every layer of risk.

The reserve disclosure is a source to inspect, not a license to double-count. The same underlying economic exposure should not appear once as native reserves and again as newly created wealth merely because a wrapper exists.

We do not reproduce a reserve total as current here. The publication's purpose is to make the relationships legible before a reader evaluates any application.

THE TAKEAWAY

cbLTC is a claim with a network and an issuer.

[109] Coinbase Help: wrapped assets and network identities [110] Coinbase cbLTC reserve disclosure

THE INSTITUTIONAL NOTEBOOK

Conviction can survive a risk register

A respectful celebration leaves room for hard questions.

A qualitative risk map; positions are not measured risk scores.

Litecoin's longevity is part of its story. It does not prove that every future condition will be favorable. A durable research practice keeps distinct risks visible: software defects, mining economics, key loss, exchange dependence, privacy limitations, liquidity, legal changes and the risks of products layered around the network.

Each entry needs a mechanism, an affected party and an observable warning sign. A software risk is not the same as a custodial risk. A proposed mitigation is

not the same as a deployed one. A repaired incident remains part of the record without becoming a claim that the present network is broken.

The purpose of a risk register is to make discussion useful. It should help a builder decide what to test, an operator decide what to monitor and a reader decide which claim needs more evidence. It is not a table of personalized investment instructions.

Communities grow stronger when criticism can be specific, sourced and answered. A birthday issue can express affection for the work while maintaining that standard.

THE TAKEAWAY

A respectful celebration leaves room for hard questions.

THE NEXT CHAPTER

Many hands. One humanity.

Satnam Satoshi is an invitation to build in service of others.

Satnam Satoshi brings two sources of inspiration into one public project: the discipline of open, verifiable money and the practice of seva, selfless service. We want newcomers and experienced Bitcoiners to find something useful to learn, make and give. The aim is a community of humans and AI working under human responsibility.

The website already offers open learning, LTC Media, planning tools and an open-source contribution route. Satoshi Langar and Kalakar.x are proposed programs with practical first-step briefs. Their presence here is

an invitation to help develop them, not a claim that kitchens, paid commissions or a legal trust are already operating.

Our connection to Litecoin begins with curiosity, respect for builders and a belief that useful work should be visible. This magazine is published independently by our project. Litecoin contributors, the Foundation and book authors have not been appointed as our partners or represented as endorsing us. Human owners retain governance, editorial and financial authority. The project becomes stronger when that boundary is clear.

[Explore Satnam Satoshi ↗](#) [Open-source project ↗](#)

THE TAKEAWAY

Satnam Satoshi is an invitation to build in service of others.

[111] Satnam Satoshi open-source project [112] Sikh Coalition: beliefs and seva

THE NEXT CHAPTER

A long table, with no price of entry.

Satoshi Langar begins with a meal and equal dignity.

Langar is the Sikh tradition of a free community kitchen and shared meal, open to all. The meal is more than a distribution system: it expresses equality through the ordinary acts of sitting together, cooking, serving and cleaning. A sevadar is someone who serves.

Our proposed Satoshi Langar pilot starts locally. A human host and experienced food-safety lead would agree the need, venue, permissions, dietary access and realistic budget. Volunteers would prepare and serve.

Langar planning toolkit ↗

AI could help translate instructions, draft a shopping list or identify omissions; it cannot inspect a kitchen or replace human judgment about safety.

A guest should not need a wallet, a photograph, proof of need or a religious test to eat. A public report could describe the event, costs and aggregate outcomes while protecting personal details. No kitchen event is claimed as active in this edition. The next useful step is a host-reviewed plan, followed by the permissions and dry run needed to turn that plan into hospitality.

THE TAKEAWAY

Satoshi Langar begins with a meal and equal dignity.

[113] Satoshi Langar pilot design [114] Sikh Coalition: introduction to langar

THE NEXT CHAPTER

Proof of service, not a token of virtue.

Evidence can help a project learn without turning people into a surveillance system.

Original conceptual guide; proposed roles and processes are not completed activity.

Our proposed Proof of Seva record connects an agreed task to minimal evidence and independent human review. It is an operational practice, not a blockchain consensus mechanism. A receipt, a photograph or an AI summary cannot by itself prove that a meal was safely served or that every guest was treated well.

For a human contribution, record the task, a consented name or pseudonym, the result and reviewer decisions. For an agent, record its human operator, bounded assignment, sources, output

version and actual cost where known. An approved translation can count as a useful contribution; it must never be counted as a meal.

If a future pilot has a budget for expense reimbursement or fixed sats grants, the task, amount and eligibility must be agreed before work begins. Humans would resolve disputes and authorize any payment. No reward program is active now, and a grant must never buy priority access to food. The record should support accountability and correction while leaving dignity intact.

[Service-record template ↗](#)

THE TAKEAWAY

Evidence can help a project learn without turning people into a surveillance system.

[113] Satoshi Langar pilot design

THE NEXT CHAPTER

The artist keeps the voice.

Kalakar.x proposes a direct path from a clear creative brief to artist-controlled payment.

A poster for a kitchen, a song for a gathering, an illustration that makes a protocol understandable: art can give a community a language before it has a large audience. Kalakar.x invites artists, musicians, writers and makers to begin with one bounded piece of work.

The proposed commission flow starts with agreement on the deliverable, attribution, license, revisions, price and dispute process. An artist-controlled Bitcoin or Lightning invoice is a candidate payment route, with

BTCPay Server identified for evaluation. The artist would retain control of the receiving setup; joining the project would not surrender rights.

The first pilot still needs a consenting artist and a tested journey through invoice state, settlement, delivery and refund handling. A marketplace and checkout are not active. AI assistance should be disclosed where relevant, and supporting a kitchen remains a separate voluntary choice. For now, the contribution is a clear brief that another person can understand, review and fairly agree.

[Kalakar.x creative brief](#) ↗

THE TAKEAWAY

Kalakar.x proposes a direct path from a clear creative brief to artist-controlled payment.

[115] Kalakar.x creator pilot design

THE NEXT CHAPTER

Give the agent a desk. Give a human the authority.

A community can welcome AI without outsourcing responsibility.

Original AI conceptual illustration. Not documentary photography or a measured data chart.

Useful agents have bounded jobs. One can collect approved public sources, another check dates, another draft an accessible explanation, and another test whether a reader can follow a link on a small screen. The output should remain inspectable: source, version, uncertainty and the person responsible for the decision.

AI Satoshi Ma is the editorial lead for this project's AI-assisted work. The role does not create a legal officer, a financial fiduciary or a substitute for independent review. Humans retain ownership and

governance. Agents do not hold community keys, promise rewards, appoint partners or approve their own evidence.

Our daily publisher has a limited factual mandate and checks before release. Original analysis and new source methods deserve their own review. This anniversary edition is an AI-prepared editorial preview, not a staffed global newsroom's reported investigation. We want that disclosure to be a starting point for collaboration: a researcher can strengthen a claim, an artist can improve a page, and a human steward can take responsibility for a program.

Contribute as a human or agent ↗

THE TAKEAWAY

A community can welcome AI without outsourcing responsibility.

[111] Satnam Satoshi open-source project

THE NEXT CHAPTER

Collect the edition. Keep the reading open.

An optional inscription could mark an edition without becoming its paywall.

Original conceptual guide; proposed roles and processes are not completed activity.

Our proposed first step is an immutable edition package: final PDF, artwork credits, source record, revision identifier and file hashes. Readers should keep free access to the website and downloadable magazine whether or not any collectible is later created.

An inscription can carry content in a transaction; a smaller record could instead carry a hash and a content address for an externally preserved edition. Those are different promises. A hash can identify the expected bytes, but does not store the complete magazine or guarantee that a remote copy remains available. IPFS content still needs maintained copies or pins.

For this Litecoin anniversary, we propose evaluating a Litecoin inscription of a compact provenance record before considering recurring editions. The ord-litecoin project calls its software experimental. Chain choice, content rights, metadata, storage, fee limit and a separate owner-controlled wallet would require explicit review and approval. No inscription, NFT, token, collectible rights or financial return is offered here. Corrections would create a new revision, leaving the earlier record discoverable.

Proposal only. Nothing minted or inscribed.

A collectible does not automatically transfer copyright.

THE TAKEAWAY

Proposal only. Nothing minted or inscribed.

[116] Ordinals: inscriptions [117] ord-litecoin project [118] Persistence, permanence and pinning

THE NEXT CHAPTER

The reading room has more than one voice.

Bring a source. Keep its point of view visible.

Original conceptual guide; proposed roles and processes are not completed activity.

The contributor links supplied for this edition connect code, community writing, project announcements and institutional research. They do not all perform the same job. A developer's repository describes software; an issuer's filing describes a financial structure; a community article may argue a point of view.

Our companion reading room links Indigo, Loshan, David Burkett, Master and @daddycool1991, alongside Litecoin.com, Litecoin.org, Look Into Litecoin and Litecoin Register. Where a social

timeline could not be read, we say so. The Foundation's own records support named professional roles; a handle alone is not a biography.

A reader can help by supplying an exact record and date, explaining which sentence it supports and identifying what should change. No one must agree with every editorial choice to contribute. Curiosity is more useful than a forced consensus. The purpose of the room is to make a better next question possible while preserving the evidence behind this edition.

THE NEXT CHAPTER

A colophon for the curious.

How this birthday edition was made.

Original conceptual guide; proposed roles and processes are not completed activity.

Proof of Birthday is revision 2 of LTC Media's independent 84-page Litecoin special. It adds contributor recognition, a dated merged-mining directory, a book spotlight, proposed integrations and the Satnam Satoshi program story. The earlier advance edition remains accessible in the revision archive.

Original conceptual illustrations were generated for this project. They are not photographs of named people, events, hardware deployments or verified network topology. The page diagrams are editorial explanations; where a number appears, its date,

scope or fictional status belongs with it. Typographic book cards are not reproductions of the publishers' covers.

The web reader and print PDF share their page compositions, sources and reading order. Phones receive a responsive text layout. AI Satoshi Ma prepared the editorial and design work; independent human review is pending. The source code remains on the project's review branch. The planned October 15 cover date does not claim future reporting, schedule an inscription or imply approval from the Litecoin Foundation, Charlie Lee, a contributor or a financial institution.

Earlier advance edition ↗

A small glossary for a large conversation

Twelve terms that make the rest of the edition easier to question.

An original editorial map, not live data or a claim of completed activity.

Definitions here are short educational guides. The surrounding chapters and primary records supply the implementation details. A term can have a

precise legal or technical meaning in its own context; do not let a familiar word conceal a different contract or system.

LTC / The native asset of the Litecoin network.

Litoshi / One hundred-millionth of one LTC.

Node / Software that checks the chain under its configured rules.

Proof of work / A consensus mechanism using computational work.

UTXO / An unspent transaction output available to be spent under its conditions.

Halving / A scheduled reduction in the block subsidy at a block-height boundary.

MWEB / Litecoin extension-block technology for optional confidential transfers.

Merged mining / Reusing proof-of-work effort across compatible chains.

Custody / The arrangements controlling and safeguarding signing authority.

ETP / An exchange-traded product whose exact structure needs checking.

NAV / Net asset value under a stated valuation method.

Testnet / A network used for testing; it is not a claim of production readiness.

THE TAKEAWAY

LTC / The native asset of the Litecoin network.

A CONTRIBUTION INVITATION / ORIGINAL EDITORIAL

The next contribution can be small

A proposed way to join the work without pretending to speak for everyone.

An invitation to useful work. No reward, affiliation or acceptance is promised.

An open project offers more entry points than writing consensus code. A newcomer can identify an unclear paragraph. A translator can make a reviewed explanation available to another community. A designer can improve a warning or a recovery instruction. An experienced engineer can review a patch, reproduce a bug or explain a tradeoff without demanding that everyone already know the vocabulary.

Start with a bounded task and the project's own contribution process. Read the issue, describe what you can verify and leave a useful record. Ask before

using someone's story or image. Never make a person's private circumstances, keys or wallet balance a price of admission to the community.

For LTC Media, the invitation is equally concrete: bring a primary source, a precise correction or a question that deserves a better explanation. This edition does not promise payment, project acceptance or a response deadline.

The next fifteen years will need patient maintenance as much as new ideas. A small contribution that another person can use is already a meaningful beginning.

THE TAKEAWAY

A proposed way to join the work without pretending to speak for everyone.

[121] Litecoin Core: open source repository [4] LTC Media editorial and correction policy

PLANNED ANNIVERSARY REVISION / NOT YET PERFORMED

The October 15 checkpoint

A future editorial task, not a report from the future.

Future events remain unreported. A later issue needs new evidence and a new revision.

This advance edition closes its research on October 4, 2026. Before an anniversary-date revision is labeled current through October 15, the editorial desk must revisit the primary records and decide what actually changed. The passing of a calendar date is not evidence of a completed event.

The checkpoint should look for new Litecoin Core releases or security notices, Foundation announcements, project readiness changes and relevant issuer or regulator documents. It should verify the sources and dates of any community

celebrations before describing them as having taken place. Any new financial quantity needs its own effective time and scope.

If no new primary evidence changes a historical chapter, that chapter can remain unchanged. If a statement needs correction, the revision should say what changed and preserve the earlier record. New analysis or sensitive claims still need the appropriate editorial review.

No future interview, celebration, product launch, endorsement or price is invented to fill these pages. The birthday deserves a truthful archive.

Recheck source dates and project status.

Reconcile all changed figures; preserve unavailable fields.

Verify any new quotations against their original record.

Release a numbered revision with an additions/corrections note.

THE TAKEAWAY

Recheck source dates and project status.

[4] LTC Media editorial and correction policy
